

PRECISELY IDENTIFY CHANGES TO COGNITIVE FUNCTION FOR ANY STUDY

SmartSignals Cognitive Assessments comprises a range of computerized tests to help clinical researchers determine the impact of investigational compounds on study participants' cognition. Developed by Signant Health and widely accepted internationally, our computerized Cognitive Assessments have been extensively validated and proven as a precise method of detecting subtle cognitive changes regardless of the disease, drug development phase, or participant population size or type.

Cognitive Assessments provides researchers with all the features needed to efficiently gauge the effect of a compound on cognitive functioning:

ACCURACY & SENSITIVITY

Precisely assess working and episodic memory, attention, or executive function tasks relevant in everyday life

SIMPLE, FAST ADMINISTRATION

Non-specialists can administer Cognitive Assessments in 30 minutes

ANY STUDY, ANY COMPOUND

Identify changes in cognitive function for any study and any compound including those with healthy volunteers

Why choose SmartSignals Cognitive Assessments?

Understand and assess the effect of a drug or therapy on cognitive function with an assessment solution that is:

01 Configurable to support any study objectives

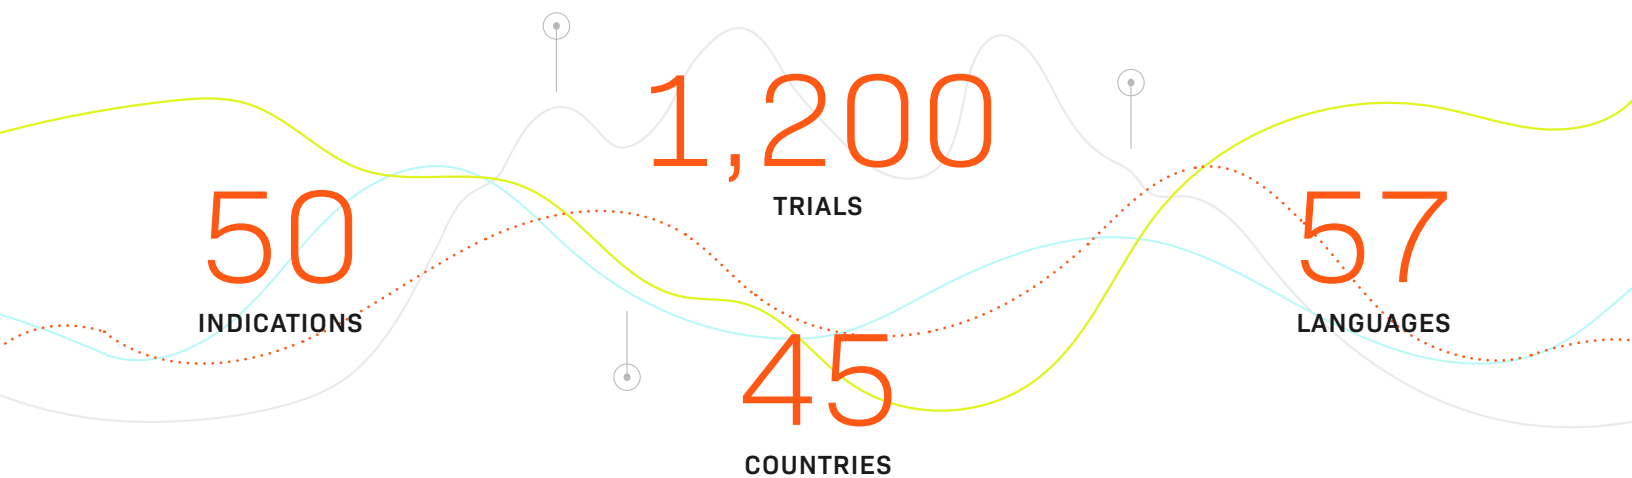

02 Ready for international use with over 50 language versions

03 Supported by Signant's cognitive advisory experts available from study design to final cognitive report

04 Integrated with eCOA, allowing data to automatically upload to secure databases for immediate review

05 Unrivaled in sensitivity and designed for repeated use

06 An industry standard assessment solution trusted worldwide for over 30 years
